

Unit-4

Prepare a PPT/Poster about the future scope of mobile applications implementing AR/VR

- Education: AR/VR can be used to create immersive educational experiences that allow students to learn in a more engaging and interactive way. For example, students could use AR to view 3D models of historical artifacts or to take virtual field trips to different parts of the world.
- Gaming: AR/VR is already being used to create some of the most immersive and engaging games ever made. As the technology continues to develop, we can expect to see even more innovative and exciting AR/VR games.
- Retail: AR/VR can be used to help customers visualize products before they buy them. For example, a customer could use AR to see how a piece of furniture would look in their living room or to try on different clothes before they buy them.
- Tourism: AR/VR can be used to create virtual tours of different places. This could be used to help people plan their vacations or to give them a taste of a place before they visit.
- Healthcare: AR/VR can be used to provide medical training and education, to assist with surgery, and to provide therapy. For example, AR could be used to help doctors train for new procedures or to provide patients with exposure therapy for phobias.

These are just a few of the many potential applications of AR/VR in mobile applications. As the technology continues to develop, we can expect to see even more innovative and exciting ways to use AR/VR in our everyday lives.

Here are some specific examples of how AR/VR is being used in mobile applications today:

- Google Translate: The Google Translate app uses AR to allow users to translate text in real time.
- IKEA Place: The IKEA Place app uses AR to allow users to see how furniture would look in their home before they buy it.
- The Pokémon Go: The Pokémon Go game uses AR to allow users to catch Pokémon in the real world.
- Ever note: The Ever note app uses AR to allow users to take notes and create sketches in the real world.
- Google Earth VR: The Google Earth VR app allows users to explore the world in virtual reality.

These are just a few examples of the many ways that AR/VR is being used in mobile applications today. As the technology continues to develop, we can expect to see even more innovative and exciting ways to use AR/VR in our everyday lives.
